Generic Manifolds $M$, $n-1 < \text{real dim}M < n$, are natural objects in the complex space $\mathbb{C}^n$. Every generic manifold is uniqueness set for holomorphic functions (Bishop, Pinchuk, 1974). If $E$ is a subset of $M$ of positive measure, then $P$-measure of $E$ is not trivial (Sadullaev, 1976). The main result is

**Theorem.** (Sadullaev-Zeriahi, 2009). Generic manifold $M$ is pluriregular, i.e. the Green function $V(z, M)$ is equal to $-1$ on $M$.

In the proof we used the attaching disks to $M$ by some arc of unit circle.
